

**Tutorial Sheet - Gas Laws and Specific Heat (gases)**

1. A compressed air tank has a volume of  $0.5\text{m}^3$ . A pressure gauge fitted to the tank reads  $1.96\text{ MPa}$  and the barometric pressure is  $103\text{kPa}$ . The temperature of the air in the tank is  $50^\circ\text{C}$ . Determine:
  - (i) the absolute pressure of the air in the tank.
  - (ii) the volume of air would occupy at s.t.p.  
(standard temperature and pressure,  $t = 0^\circ\text{C}$ .,  $p = 101.3\text{ kPa}$ ).
  - (iii) the mass of air in the tank if the gas constant for air is  $0.287\text{ kJ/kg K}$ .  
( $2.063\text{ MPa}$ ;  $8.61\text{ m}^3$ ;  $11.1\text{ kg}$ )
  
2. A cylindrical gas reservoir  $6.7\text{ m}$  long contains  $545\text{ kg}$  of gas at a pressure of  $1.138\text{ MPa}$  (gauge) and temperature  $24^\circ\text{C}$ . Calculate the volume and diameter of the reservoir, given that  $0.02332\text{m}^3$  of the gas at atmospheric pressure ( $101.3\text{ kPa}$ ) and  $0^\circ\text{C}$  has a mass of  $0.0366\text{ kg}$ . Determine also, the volume of the gas at atmospheric pressure and  $24^\circ\text{C}$  required to fill the reservoir to the pressure of  $1.138\text{ MPa}$ .  
( $30.88\text{ m}^3$ ;  $2.42\text{m}$ ;  $377.8\text{m}^3$ .)
  
3. An empty steel cylinder has a volume of  $0.04\text{ m}^3$ . A certain gas is pumped in until the pressure and temperature in the cylinder are  $12\text{ MPa}$  and  $45^\circ\text{C}$ . The mass of the cylinder is found to have increased by  $5\text{ kg}$ . Determine the value of the gas characteristic constant,  $R$ .  
( $0.302\text{ kJ/kg K}$ ).
  
4. A cylinder of internal diameter  $200\text{ mm}$  is fitted with a freely sliding piston and contains  $1\text{ kg}$  of air at  $1\text{ MPa}$  and  $20^\circ\text{C}$ . How much heat must be transferred to the air in order to raise its temperature to  $40^\circ\text{C}$ :
  - (a) if the piston is fixed so that the process takes place at constant volume
  - (b) if the process takes place at constant pressure?  
  
For (b) calculate (i) the force on the piston  
(ii) the distance through which it moves.
  - (c) Show that the work done by the gas is equal to the difference between (a) and (b).  
For air,  $C_p = 1.005\text{ kJ/kg K}$ ;  $C_v = 0.718\text{ kJ/kg K}$ ;  $R = 0.287\text{ kJ/kg K}$ .  
( $14.36\text{ kJ}$ ,  $20.1\text{ kJ}$ ,  $31.42\text{ kN}$ ,  $182.7\text{ mm}$ ).
